

Press release: 14 June 2021

Mathys expands the established leggera portfolio with four new instruments

The medical technology company Mathys presents four new additions to its leggera portfolio: **balanSys Femur Rotation Bearings** in two sizes, the rotating **balanSys Eminentia Shackle** and the **balanSys Positioner for the RP Tibial Plateau**. The new optional instruments offer surgeons additional options when performing operations with **balanSys BICONDYLAR** implants. The **leggera Additional Instruments** are available from 14 June 2021.

High precision and greater efficiency

The intuitive and ergonomic leggera instruments enable surgeons to carry out precise and efficient operations with implants in knee replacement surgery. The new optional instruments expand the leggera portfolio from Mathys and reinforce this philosophy.

For example, the **balanSys Femur Rotation Bearings in two sizes** enable simple and secure positioning of the Femoral Sizing and Rotation Guide – even in narrow space. The rotating **balanSys Eminentia Shackle**, on the other hand, can be used for varus/valgus adjustment in combination with the intramedullary tibia alignment. Finally, the **balanSys Positioner for the RP Tibial Plateau** assists when implanting the balanSys RP Tibial Plateau. As additions to the leggera portfolio, the four new instruments fit in the existing leggera trays and are offered optionally. All new additions are available from 14 June 2021.

The leggera portfolio: foundation for successful operations

Intuitive, efficient, precise – the foundation for successful implant operations in knee replacement surgery with leggera instruments. The Italian phrase ‘leggera’ means ‘light’ or ‘easy’, and – as the name suggests – the leggera instrument range from Mathys makes the work of operating surgeons easier. The instruments have been developed specifically for operations with balanSys BICONDYLAR implants, with a focus on handling that is as intuitive as possible. The ergonomic design also

guarantees logical workflows, thereby supporting efficient prosthesis implantation. Another plus point of the leggera instruments is the precise settings, which facilitate reproducible results.

About Mathys Ltd Bettlach

The Swiss orthopaedic company was established in 1946 and can look back on 60 years' experience in the field of medical technology. Since 2003, Mathys has been wholly devoted to the development, manufacture and sale of joint replacement products. The majority of products are made in Switzerland, with some manufacturing in Germany. The company's range includes implants for hips, knees and shoulders as well as synthetic bone substitute material. Mathys entered the field of sports orthopaedics in 2013.

The company has 11 subsidiaries in Germany, France, Belgium, UK, Netherlands, Italy, Japan, Austria, Australia, New Zealand and Switzerland, and is wholly owned by the Mathys and Marzo families.
